### Chapter 7: Introduction & Sections 7.9-7.11

- Describe what is meant by axial muscles: Arise on axial skeleton. They position the head and spinal column and also move the rib cage, assisting in the movements that make breathing possible. They do not play a role in movement or support of the pectoral or pelvic girdles or the limbs. This category includes roughly 60 percent of the skeletal muscles in the body.
- Describe what is meant by appendicular muscles: stabilize or move components of the appendicular skeleton.
- The origin is the attachment at the end of the muscle that serves as an anchor, while the insertion is the end of the muscle that is moving the body part.
- Define each of the following terms as they relate to skeletal muscles:
  - Prime mover: a muscle whose contraction is chiefly responsible for producing a particular movement.
  - Antagonist: is a muscle whose action opposes the movement produced by another muscle.
  - Synergist: is a muscle that helps a prime mover work efficiently. Synergists may either provide additional pull near the insertion or stabilize the point of origin.
- What does the name *flexor carpi radialis longus* tell you about this muscle?  
bending movement wrist forearm long - the long muscle in the wrist/forearm that produces a bending movement (tells you location, action, and striking feature).
- List the four groups of axial muscles and their general actions:

Muscle Group	General Actions
Muscles of the head and neck	These muscles include those responsible for facial expression, chewing, and swallowing.
Muscles of the spine	This group includes flexors and extensors of the head, neck, and spinal column.
