Middle adulthood: (physical development)

- Hair grays and thins
- New lines appear on face
- Fuller, less youthful body shape is evident
- Ages 40-65
- Changes include, physical, cognitive and time orientation

Vision changes;

- During 40's difficulty reading small print is common (thickening of lens combined with weakening of muscle that enables eye to focus)
- By age 50, the accommodative ability of the lens is one-sixth of what it was at age 20.
- **Presbyopia**- "old eyes" (age 60) the lens loses its capacity to adjust to objects at varying distances.
- Pupils shrink and lens begin to yellow.
- Higher risk of Glaucoma in middle aged adults.

Hearing;

- 14% of Americans between ages 45 and 64 suffer from hearing loss.
- Often hearing loss results from adult-onset hearing impairments.
- Some conditions are hereditary
- **Presbycusis**- "old hearing"
- Gender and culture play in this.
- Men show earlier (rapid decline)
- Hearing aids

Skin;

- 3 layers...
- 1. Epidermis- outer protective layer.
- 2. Dermis- middle supportive layer
- 3. Hypodermis- inner fatty layer that adds to the soft lines and shape of the skin.
- Wrinkles - forehead starts to show earlier (30's)
- Sagging begins in arms, face, and legs.
- Faster signs of age in women.

15 Concept Development:

Concept Development in the Secondary School Peter Langford, 2016-03-10 Originally published in 1987 this book introduces the reader to work on the intellectual development of adolescents relevant to the secondary school teacher It covers the teaching of English history geography economics politics legal studies physics chemistry biology and mathematics Although it emphasises the continuing importance of Piaget's thought the book aims to introduce readers to the non Piagetian research that had taken place in recent years

The Making of Human Concepts Denis Mareschal, Paul C. Quinn, S. E. G. Lea, 2010 Human adults appear different from other animals in their ability to form abstract mental representations that go beyond perceptual similarity In short they can conceptualize the world This apparent uniqueness leads to an immediate puzzle WHEN and HOW does this abstract system come into being To answer this question we need to explore the origins of adult concepts both developmentally and phylogenetically When does the developing child acquire the ability to use abstract concepts Does the transition occur around 2 years with the onset of symbolic representation and language Or is it independent of the emergence of language When in evolutionary history did an abstract representational system emerge Is there something unique about the human brain How would a computational system operating on the basis of perceptual associations develop into a system operating on the basis of abstract relations Is this ability present in other species but masked by their inability to verbalise abstractions Perhaps the very notion of concepts is empty and should be done away with altogether This book tackles the age old puzzle of what might be unique about human concepts Intuitively we have a sense that our thoughts are somehow different from those of animals and young children such as infants Yet if true this raises the question of where and how this uniqueness arises What are the factors that have played out during the life course of the individual and over the evolution of humans that have contributed to the emergence of this apparently unique ability This volume brings together a collection of world specialists who have grappled with these questions from different perspectives to try to resolve the issue It includes contributions from leading psychologists neuroscientists child and infant specialists and animal cognition specialists Taken together this story leads to the idea that there is no unique ingredient in the emergence of human concepts but rather a powerful and potentially unique mix of biological abilities and personal and social history that has led to where the human mind now stands A must read for students and researchers in the cognitive sciences
