

# 16 Darwin's Theory of Evolution

## Big Idea → Evolution

**Q:** What is natural selection?

**16.1** What patterns of biodiversity did Darwin observe aboard the *Beagle*?

### WHAT I KNOW

**Science answer:** On each island that Darwin visited, he saw different species of plants and animals.

**16.2** How did other scientists' work help Darwin develop his theory of natural selection?

**Science answer:** Other scientists did research on how organisms inherited different traits.

**16.3** What is Darwin's theory of evolution by natural selection?

**Science answer:** Organisms that are best adapted to their environment survive longer and have more offspring.

**16.4** What are the main lines of scientific evidence that support Darwin's theory of evolution by natural selection?

**Science answer:** Fossils show how organisms have changed over time.

### WHAT I LEARNED

**Science answer:** Darwin noticed that different, yet similar, species inhabited separated, but similar, habitats around the globe. Also, different, yet related, species often occupied different habitats within a focal area.

**Science answer:** Buffon and Lyell concluded that Earth is extremely old. Lamarck suggested that species are not fixed. Malthus reasoned larger populations would deplete resources.

**Science answer:** Natural selection is the process by which organisms with variations most suited to their local environment survive and leave more offspring. Over time, beneficial traits accumulate in a population.

**Science answer:** Biogeography, fossils, homologous structures, similarities in embryological development, the universal genetic code, homologous molecules, and field studies provide evidence of evolution.
