Genetics Joins Evolutionary Theory

Gregor Mendel's original ideas on how hereditary information is passed:

- 1. Hereditary information that comes from parents are controlled by genes and that these genes have a hereditary basis, in other words, they have a different allele in an individual's genotype. Genotype is the combination of alleles you inherit from your parents.
- 2. Genes are passed on from one generation to the next in populations. Alleles in a population come in discrete groups of genes, called genes.
- 3. Allele frequency: is the number of copies of an allele in a given pool. Allele frequency is the number of alleles in a population that have a given trait, divided by the total number of alleles in the population.

Examples of Mendel's "hereditary" factors: Mendel's pea plants had discrete hereditary traits: flower color, seed shape, seed color, etc.

- 1. Alleles are the different versions of a gene.
- 2. Genes are passed on from one generation to the next in discrete groups. The number of alleles in a population is the number of alleles in the population. Alleles are passed on from one generation to the next.
- 3. Alleles are passed on from one generation to the next in discrete groups. The number of alleles in a population is the number of alleles in the population.

Single Gene and Polygenic Traits Hereditary information is passed on from one generation to the next in discrete groups, called genes.

- 1. Single gene trait is controlled by one gene. An example is the color of a pea plant's seeds.
- 2. Polygenic trait is controlled by more than one gene. An example is the height of a pea plant.
