

17.3 The Process of Speciation

Lesson Objectives

-  Identify the types of isolation that can lead to the formation of new species.
-  Describe the current hypothesis about Galápagos finch speciation.

Lesson Summary

Isolating Mechanisms **Speciation** is the formation of new species. For one species to evolve into two new species, the gene pools of two populations must become separated, or reproductively isolated. **Reproductive isolation** occurs when members of two populations do not interbreed and produce fertile offspring. Reproductive isolation can develop through behavioral, geographic, or temporal isolation.

- ▶ **Behavioral isolation** occurs when populations have different courtship rituals or other behaviors involved in reproduction.
- ▶ **Geographic isolation** occurs when populations are separated by geographic barriers, such as mountains or rivers.
- ▶ **Temporal isolation** occurs when populations reproduce at different times.

Speciation in Darwin's Finches Peter and Rosemary Grant's work supports the hypothesis that speciation in the Galápagos finches was, and still continues to be, a result of the founder effect and natural selection.

- ▶ Speciation in Galápagos finches may have occurred in a sequence of events that involved the founding of a new population, geographic isolation, changes in the gene pool, behavioral isolation, and ecological competition.
- ▶ For example, a few finches may have flown from mainland South America to one of the islands. There, they survived and reproduced. Some birds may have crossed to a second island, and the two populations became geographically isolated. Seed sizes on the second island could have favored birds with larger beaks, so the population on the second island evolved into a population with larger beaks. Eventually, these large-beaked birds became reproductively isolated and evolved into a new species.

Isolating Mechanisms

1. What is speciation?

It is the formation of new species.

2. What does it mean for two species to be reproductively isolated from each other?

Members of the two species do not interbreed and produce fertile offspring.

3. What must happen in order for a new species to evolve?

Populations must be reproductively isolated from one another.

College Biology II James Hall Zimmerman,1963 **Ancestors in Our Genome** Eugene E. Harris (Professor),2015 In 2001 scientists were finally able to determine the full human genome sequence and with the discovery began a genomic voyage back in time Since then we have sequenced the full genomes of a number of mankind s primate relatives at a remarkable rate The genomes of the common chimpanzee 2005 and bonobo 2012 orangutan 2011 gorilla 2012 and macaque monkey 2007 have already been identified and the determination of other primate genomes is well underway Researchers are beginning to unravel our full genomic history comparing it with closely related species to answer age old questions about how and when we evolved For the first time we are finding our own ancestors in our genome and are thereby gleaning new information about our evolutionary past In *Ancestors in Our Genome* molecular anthropologist Eugene E Harris presents us with a complete and up to date account of the evolution of the human genome and our species Written from the perspective of population genetics and in simple terms the book traces human origins back to their source among our earliest human ancestors and explains many of the most intriguing questions that genome scientists are currently working to answer For example what does the high level of discordance among the gene trees of humans and the African great apes tell us about our respective separations from our common ancestor Was our separation from the apes fast or slow and when and why did it occur Where when and how did our modern species evolve How do we search across genomes to find the genomic underpinnings of our large and complex brains and language abilities How can we find the genomic bases for life at high altitudes for lactose tolerance resistance to disease and for our different skin pigmentations How and when did we interbreed with Neandertals and the recently discovered ancient Denisovans of Asia Harris draws upon extensive experience researching primate evolution in order to deliver a lively and thorough history of human evolution *Ancestors in Our Genome* is the most complete discussion of our current understanding of the human genome available **Functional Assessment of Wetlands** E. a wetland area without the need for comprehensive and expensive empirical research The FAPs therefore provide a methodology that can be used by both experts and non experts to assess wetland functioning relatively rapidly The volume includes an electronic version of the FAPs on CD which automates aspects of the assessment once the initial recording stage is completed It is anticipated that the FAPs will be used by a range of individuals or organisations concerned with wetland management who wish to gain a better understanding of the processes functions services or benefits and potential of the wetlands for which they have responsibility Provides a systematic methodology to evaluate how wetlands function Allows non experts to assess wetland functioning rapidly and cost effectively Automates aspects of the functional assessment through the accompanying CD ROM
