BIM models In this study generated workspaces are utilized to demonstrate areas occupied by workers or equipment instead of using individual tags for each entity As construction workers may leave their work zone for some reasons 3D video tracking is applied for identifying and tracking if workers leave their pre defined workspaces The developed model captures the load position in real time and subsequently compares the load s bounding box position with defined area in BIM model In the developed model tower crane s load dimensions and starting point of the loading procedure are inserted and subsequently the model updates the load s position in real time The updated position in the 3D model is checked proactively with existing spaces to send alerts in case of overlapping Two case studies are used to demonstrate the concept and to validate the feasibility of the proposed method In the first case study the added plug in is used to generate workspaces for material equipment and labors and in the second one the real time safety system is validated in two different scenarios The developed plug in in Revit environment enhances timely proximity detection for enhanced safety since it detects objects based on pre defined spaces and retrieves crane s load location in the model in real time Identifying resources of interest which being free of tag and developing the real time conflict detection in Revit can be addressed as main findings of this study
