Guide to Psychological Assessment with Asians Lorraine T. Benuto, Nicholas S. Thaler, Brian D. Leany, 2014-06-26. To effectively serve minority clients, clinicians require a double understanding of both evidence-based practice and the cultures involved. This particularly holds true when working with Asian Americans, a diverse and growing population. The Guide to Psychological Assessment with Asians synthesizes real world challenges, empirical findings, clinical knowledge, and common sense advice to create a comprehensive framework for practice. This informed resource is geared toward evaluation of first generation Asian Americans and recent immigrants across assessment methods, self-report measures, projective tests, settings, school, forensic, and classes of disorders, eating, substance, sexual. While the Guide details cross-cultural considerations for working with Chinese, Japanese, Korean, and Indian American clients, best practices are also included for assessing members of less populous groups without underestimating, overstating, or stereotyping the role of ethnicity in the findings. In addition, contributors discuss diversity of presentation within groups and identify ways that language may present obstacles to accurate evaluation. Among the areas covered in this up-to-date reference: Structured and semi-structured clinical interviews; Assessment of acculturation, enculturation, and culture; IQ testing; Personality disorders; Cognitive decline and dementia; Mood disorders and suicidality; Neuropsychological assessment of children, adolescents, and adults; Culture-bound syndromes. Designed for practitioners new to working with Asian clients as well as those familiar with the population, the Guide to Psychological Assessment with Asians is exceedingly useful to neuropsychologists, clinical psychologists, health psychologists, and clinical social workers.

Computational Surgery and Dual Training Marc Garbey, Barbara Lee Bass, Christophe Collet, Michel de Mathelin, Roger Tran-Son-Tay, 2009-12-16. The future of surgery is intrinsically linked to the future of computational sciences: the medical act will be computer assisted at every single step from planning to post-surgery recovery and through the surgical procedure itself. Looking back at the history of surgery, surgery practice has changed dramatically with the extensive use of revolutionary techniques such as medical imaging, laparoscopy, endoscopy, sensors and actuators, and robots. This trend is dependent on the use of computer processing, computational method, and virtualization. Computational surgery will not only improve the efficiency and quality of surgery but will also give new access to very complex operations that require extreme precision and minimum intrusion. Such examples are today's inoperable cancer tumors that have invaded critical tissues or nervous centers. In order for this milestone to be reached, quicker and more efficiently, surgeons will have to become very familiar with computing methods such as image analysis, augmented reality, and/or robotics. It will be critical for surgeons to assimilate computers in their training, understand how computers work, understand the limitations and advantages of these computer tools, and be able to interpret computer imaging and simulations.
