ENRICHMENT**• Relative Ages of Rocks****Creating a Rock Sequence**

Using the sequence of historical events listed below, complete the cross-section diagram to show the events according to the principle of superposition. Use the symbols given in the key, and label each layer according to its place in the sequence.

- (A) The ocean covers the area; coral thrive and limestone deposits are formed.
- (B) Mud washes in and is later pressed into layers forming shale.
- (C) Coral thrive again. Limestone forms.
- (D) A normal fault occurs.
- (E) Sand is deposited and later cemented.
- (F) Coral deposits occur, forming limestone.
- (G) The entire area is uplifted above the ocean, and the coral-rich limestone erodes.
- (H) The area is again covered by the ocean, and mud washes in, forming shale.
- (I) A disconformity marks the change from limestone to shale.
- (J) Magma moves up through the existing rock layers and crystallizes to form a dike.

Mebus A. Geyh,Helmut Schleicher,2012-07-05 With the growing recognition during the last two centuries that the Earth has an immense age and processes over long periods of time have changed the morphology and composition of the Earth s crust geologists have become increasingly interested in determination of absolute ages A rela tive geochronology was established on the basis of the lithostratigraphic and biostratigraphic principles developed during the last century With the discovery of radioactivity the basis for a new geoscientific discipline geochronology was established Rutherford 1906 It is the study of geological time based mainly on the time signatures provided by the isotopic composition in geologic materials The isotopic signature in a rock yields more information than that provided by the geochemical signature alone because it reflects the origin and history of the element in the rock The aim of geochronology is to calibrate and standardize chronostrati graphic scales to develop geological time scales that have a sensitive or at least useful resolution in order to place the geological events in the correct chronological order and to assign their proper time spans In practice the application of geochronology is much wider because the data in the natural archives often provide information on the origin genesis and history of the materials This of course requires an understanding of the geochemical behavior of the substances involved **Calculation**
