Lakshminarayanan, Ajoy Ghatak, K. Thyagarajan, 2002 Ingeometrical optics light propagation is analyzed in terms of light rays which define the path of propagation of light energy in the limit of the optical wavelength tending to zero Many features of light propagation can be analyzed in terms of rays of course subtle effects near foci caustics or turning points would need an analysis based on the wave nature of light All of geometric optics can be derived from Fermat s principle which is an extremum principle The counterpart in classical mechanics is of course Hamilton s principle There is a very close analogy between mechanics of particles and optics of light rays Much insight and useful results can be obtained by analyzing these analogies As noted by H Goldstein in his book *Classical Mechanics* Addison Wesley Cambridge MA 1956 classical mechanics is only a geometrical optics approximation to a wave theory In this book we begin with Fermat s principle and obtain the Lagrangian and Hamiltonian pictures of ray propagation through various media Given the current interest and activity in optical fibers and optical communication analysis of light propagation in inhomogeneous media is dealt with in great detail The past decade has witnessed great advances in adaptive optics and compensation for optical aberrations The formalism described herein can be used to calculate aberrations of optical systems Toward the end of the book we present application of the formalism to

current research problems Of particular interest is the use of dynamic programming techniques which can be used to handle variational extremum problems This method has only recently been applied to optical problems The Saturday Review of Politics, Literature, Science and Art ,1897 **Athenaeum and Literary Chronicle** ,1854
