New advances in the biology and pathogenesis of free-living amoebae Isabel Marcelino, Ascel Samba-Louaka, Christopher A. Rice, 2024-05-06 Free living amoebae FLA are fascinating unicellular eukaryotes living freely in soil and freshwater habitats and feeding mainly on bacteria Under stressful conditions they can transform from a motile metabolically active and replicative trophozoite to a dormant and resistant cyst Some FLA can be pathogenic to humans such as Acanthamoeba Balamuthia Naegleria and Sappinia causing rare but fatal infection in humans FLA are also known to be carriers of pathogenic microorganisms but few information is currently available on the natural bacteria of FLA and how various bacteria avoid phagocytosis predation by these specific types of amoebae There is an imperious need to draw more attention to this group of microorganisms and for this we seek submissions that address advancements in the biology and pathogenesis of FLAs Acanthamoeba Naveed Ahmed Khan, 2009 The first comprehensive review of Acanthamoeba research to be published Everything that is known about Acanthamoeba is critically reviewed and divided into easy to follow sections The definitive guide Ophthalmic Drug Therapy Pocket Guide, Clinical Ophthalmology Alan C. defense mechanisms Now in the age of large scale comparative omics it is clear that different *Legionella* species utilize different cohorts of effectors to replicate inside eukaryotic cells While we understand some of the strategies employed by *L. pneumophila* and *L. longbeachae* to replicate within eukaryotic cells there is still much to learn about many aspects of the *Legionella* life cycle This Research Topic highlights the latest findings regarding the biology of *Legionella* species their interactions with eukaryotic host cells and how the application of various technologies has increased our understanding of this important pathogen

Molecular Parasitology Julia Walochnik, Michael Duchêne, 2016-10-20 In the past years genome projects for numerous human parasites have been completed and now allow first in depth comparisons and evolutionary conclusions The genomes of parasites reflect the coevolution with their host metabolic capacities depending on their respective habitat in the host Gut parasites usually have an anaerobic metabolism while blood parasites have an aerobic metabolism intracellular parasites escape the immune system while extracellular parasites evade the immune system usually by antigenic variation Comprehensive genome data now being available allow us to address profound scientific questions such as which traits enable the parasite to survive in the human host which to cause disease and which can be used as drug targets This book intends to give an overview of the state of knowledge on the molecules of protozoan parasites on their genomes proteomes glycomes and lipidomes
