The Connection Between Photosynthesis and Cellular Respiration

All living organisms need energy to survive. Photosynthesis and cellular respiration work together in an energy cycle that keeps life on Earth running. Photosynthesis occurs in plants, algae, and some bacteria, while cellular respiration happens in all living things, including plants, animals, and humans.

Photosynthesis: The Energy Producer

Plants use photosynthesis to capture light energy and store it in the form of glucose ($C_6H_{12}O_6$). This process takes place in the chloroplasts of plant cells. The reactants (starting materials) of photosynthesis are carbon dioxide (CO_2) and water (H_2O), which plants absorb from the air and soil. With the help of sunlight, plants convert these into glucose ($C_6H_{12}O_6$) and oxygen (O_2).

Cellular Respiration: The Energy User

Animals, plants, and most living organisms break down glucose in a process called cellular respiration. This occurs in the mitochondria of cells. Cellular respiration releases the energy stored in glucose by using oxygen (O_2) to produce ATP (adenosine triphosphate), which is the energy molecule that powers all cellular activities. The products of cellular respiration are carbon dioxide (CO_2), water (H_2O), and ATP.
