The Chacoan shrews, *Neotoma albigula*, are present at all types of coops (although shrews' burrows are present even in shrubby habitats that provide good vegetation cover for the shrews). In Chaco, the majority of the shrews occur at all types of coops, but the majority of the shrews occur at all types of coops. ### **Geospatial Technologies for Crops and Soils** Tarik Mitran, Ram Swaroop Meena, Abhishek Chakraborty, 2020-10-24

The sustainable development of the agriculture sector is the only option to meet the demands of increased and economically viable production in a changing climate. This means there is a need to introduce the latest technologies to enhance production and also help policymakers make decisions for the future. Geospatial technologies tools such as remote sensing, geographical information systems (GIS), global positioning systems (GPS), and mobile web applications provide unique capabilities to analyze multi-scale, multi-temporal datasets and support decision making in sustainable agriculture development and natural resources management. Further, the availability of reliable and timely geospatial information on natural resources and environmental conditions is essential for sustainable agricultural development and food security. Since remote sensing solutions are fast, non-destructive, and have large spatial coverage, they can play a significant role in the identification, inventory, and mapping of land resources. Over the past four decades, remote sensing has proved to be a cost-effective and powerful tool to assess crop and soil properties in varying spatial and temporal scales using both visual and digital techniques. Satellite remote sensing coupled with GIS mobile app-based positional information has emerged as an efficient tool for optimizing input resources and minimizing cost of production and risk of biotic/abiotic factors. Nature to promote sustainable agriculture. This book comprehensively documents the applications of space-based technologies for crop and soil assessments for the sustainable development of agriculture.

**Irrigation and Drainage Engineering** Peter Waller, Muluneh Yitayew, 2015-11-18. This textbook focuses specifically on the combined topics of irrigation and drainage engineering. It emphasizes both basic concepts and practical applications of the latest technologies available. The design of irrigation, pumping, and drainage systems using Excel and Visual Basic for Applications programs are explained for both graduate and undergraduate students and practicing engineers. The book emphasizes environmental protection, economics, and engineering design processes. It includes detailed chapters on irrigation, economics, soils, reference evapotranspiration, crop evapotranspiration, pipe flow, pumps, open channel flow, groundwater, center pivots, turf and landscape drip, orchards, wheel lines, hand lines, surfaces, greenhouse hydroponics, soil water movement, drainage systems design, drainage and wetlands, contaminant fate and transport. It contains summaries, homework problems, and color photos. The book draws from the fields of fluid mechanics, soil physics, hydrology, soil chemistry, economics, and plant sciences to present a broad interdisciplinary view of the fundamental concepts in irrigation and drainage systems design.

**Water use efficiency of arable and grassland crops in legume-based intercropping systems** Annika Meißner, 2021. Legume-based intercropping systems have the potential for a more efficient use of water resources. This depends on various factors such as environmental conditions and genotypic characteristics. Therefore, several genotypes of legumes and non-legumes of arable, grassland, and woody crops were tested, comparing intercropping and pure stands under both greenhouse and field conditions. Greenhouse

experiments with winter faba bean and winter wheat under water deficit revealed genotypic differences in the suitability for intercropping as well as effects on the microbial community Field experiments with direct and remote measurements showed that including legumes in arable and grassland low input systems improves water use efficiency and productivity in comparison to pure non legumes The grassland mixing partners perennial ryegrass and chicory had additional effects Furthermore arable intercropping reduced nitrous oxide emissions compared to fertilized wheat stands From the consolidated results some winter faba bean and white clover genotypes could be identified for further breeding for intercropping systems In summary intercropping with legumes improves the water use efficiency and the general performance and sustainability of the agro ecosystem

Advances in sensor technology for sustainable crop production Dr Craig Lobsey, Professor Asim Biswas, 2023-02-21 Assesses key developments in sensor technology to improve monitoring and management of complex agricultural systems Considers the growing influence of proximal crop sensors in assessing monitoring and measuring the health of agricultural soils Explores the potential of remote and aerial sensing towards achieving sustainable crop production through more targeted irrigation management site specific nutrient management and weed management

*Bioenergy Crops for Ecosystem Health and Sustainability* Alex Baumber, 2016-02-22 The growing of crops for bioenergy has been subject to much recent criticism as taking away land which could be used for food production or biodiversity conservation This book challenges some commonly held ideas about biofuels bioenergy and energy cropping particularly that energy crops pose an inherent threat to ecosystems which must be mitigated The book recognises that certain energy crops e g oil palm for biodiesel have generated sustainability concerns but also asks the question is there a better way of using energy crops to strategically enhance ecosystem functions It draws on numerous case studies including where energy crops have had negative outcomes as well as cases where energy crops have produced benefits for

ecosystem health such as soil and water protection from the cropping of willow and poplar in Europe and the use of mallee eucalypts to fight salinity in Western Australia While exploring this central argument the volume also provides a systematic overview of the socio economic sustainability issues surrounding bioenergy

**Soil Health, Soil Biology, Soilborne Diseases and Sustainable Agriculture** Graham Stirling, Helen Hayden, Tony Pattison, Marcelle Stirling, 2016-03 Our capacity to maintain world food production depends heavily on the thin layer of soil covering the Earth's surface The health of this soil determines whether crops can grow successfully whether a farm business is profitable and whether an enterprise is sustainable in the long term Farmers are generally aware of the physical and chemical factors that limit the productivity of their soils but often do not recognise that soil microbes and the soil fauna play a major role in achieving healthy soils and healthy crops Soil Health Soil Biology Soilborne Diseases and Sustainable Agriculture provides readily understandable information about the bacteria fungi nematodes and other soil organisms that not only harm food crops but also help them take up water and nutrients and protect them from root diseases Complete with illustrations and practical case studies it provides growers and their consultants with holistic solutions for building an active and diverse soil biological community capable of improving soil structure enhancing plant nutrient uptake and suppressing root pests and pathogens The book is written by scientists with many years experience developing sustainable crop production practices in the grains vegetable sugarcane grazing and horticultural industries This book will be useful for growers consultants agronomists and soil chemists extension personnel working in the grains livestock sugarcane and horticultural industries professionals running courses in soil health biological farming and students taking university courses in soil science ecology microbiology plant pathology and other biological sciences

*Recent Advances on Nitrogen Use Efficiency in Crop Plants and Climatic Challenges* Hamada AbdElgawad, 2023-08-25 Nitrogen N is a mineral nutrient that is essential for the normal growth and development of plants that is required in the highest quantity It is an element of nucleic acids proteins and photosynthetic metabolites therefore crucial for crop growth and metabolic processes Recently it was estimated that N fertilizers could meet the 48% demand of the world's population However overuse and misuse of N fertilizers raised environmental concerns associated with N losses by nitrous oxide N<sub>2</sub>O emissions ammonia NH<sub>3</sub> volatilization and nitrate NO<sub>3</sub> leaching For instance NH<sub>3</sub> is a pollutant in the atmosphere N<sub>2</sub>O is a greenhouse gas that has a warming potential 298 times higher than CO<sub>2</sub> and contributes to ozone depletion and NO<sub>3</sub> causes eutrophication of water bodies Agricultural practices account for about 90% of NH<sub>3</sub> and 70% of N<sub>2</sub>O anthropogenic emissions worldwide The efficient use of N chemical fertilizers can be attained through cultural and agronomic practices Nitrogen use efficiency NUE is an important trait that has been studied for decades in different crops The grain production or economic return from the per unit supply of N fertilizer simply explained the NUE Several definitions were suggested by different researchers NUE can be defined as the product of N uptake efficiency NUpE and N utilization efficiency NUtE An increase in NUE increases the yield biomass quality and quantity of crops N is generally applied as

chemical fertilizer to the soil whereas a small amount is added to some crops like grain legumes through the fixation process. On the other hand, crop plants take N through the root system in the form of nitrate or ammonium which is thereby used in different metabolic processes. A number of studies have been conducted to increase the NUE in different crops and it has been indicated that NUE can be improved by agronomic, physiological, biochemical breeding as well as molecular approaches. Nitrogen is the main limiting nutrient after carbon, hydrogen, and oxygen for the photosynthetic process. Phytohormonal and proteomic changes and the growth development of plants to complete their lifecycle. Excessive and inefficient use of N fertilizer results in enhanced crop production costs and atmospheric pollution. Atmospheric nitrogen 71% in the molecular form is not available for the plants. For the world's sustainable food production and atmospheric benefits, there is an urgent need to upgrade nitrogen use efficiency in the agricultural farming system. Nitrogen losses are too high due to excess amount, low plant population, poor application methods, etc. which can go up to 70% of total available nitrogen. These losses can be minimized up to 15-30% by adopting improved agronomic approaches such as optimal dosage of nitrogen, application of N by using canopy sensors, maintaining plant population, drip fertigation, and legume-based intercropping. Therefore, the major concern of modern days is to save economic resources without sacrificing farm yield as well as the safety of the global environment, i.e., greenhouse gas emissions, ammonium volatilization, and nitrate leaching.

Environmental influences on vector-borne diseases and stormflow water quality influences are also featured. Numerous examples of the environmental influences on human health from across the globe are also presented and discussed in this volume. Covers recent advances and future research topics at the intersection of environmental science and public health. Developed by 60 experts from 20 countries and edited by professionals from the International Working Group on Medical Geology. Includes 200 color photographs and illustrations. Organizes information in a highly structured format for easy reference. Written for a broad audience ranging from students, researchers, and medical professionals to policymakers and the general public.
