Chapter 22: Descent with Modification: A Darwinian View of Life

As you study this chapter, read several paragraphs at a time to catch the flow of ideas and understand the reasoning that is being described. In some places, the text describes a narrative or story of events that led to Darwin's theory of evolution. Therefore, first read the narrative to absorb the big picture and then return to answer the few questions that accompany this material.

Overview

1. Define *evolution* broadly and then give a narrower definition, as discussed in the overview.
specific: a change over time in the genetic composition of a population;
broad: populations change over generations

Concept 22.1 The Darwinian revolution challenged the traditional view of a young Earth inhabited by unchanging species

This section takes a look at the historical setting and influences on Darwin, and it sets the stage for our formal study of evolution.

2. How did each of the following sources view the origin of species?

Aristotle and Scala Naturae

Viewed species as fixed and unchanged

The Old Testament

Species were individually designed by God, and thus perfect

Carolus Linnaeus

Developed taxonomy, which would classify the diversity of God

Georges Cuvier

Believed in catastrophism, and not in evolution

3. Explain the role of *fossils* in *rock strata* as a window to life in earlier times.

Fossils are remains or traces of organisms from the past. Because rocks are in layers, time periods can be divided into such layers, and thus the gradual changes in creatures over time periods can be observed

4. How would *Georges Cuvier* have explained the appearance of the record of life shown in the rock strata?

Catastrophism: each boundary represents a catastrophe that destroyed many of the species at the time.

Holt Biology: Mendel and heredity ,2003 Origination of Organismal Form Gerd B. Muller, Stuart A. Newman, 2003-01-03 A more comprehensive version of evolutionary theory that focuses as much on the origin of biological form as on its diversification The field of evolutionary biology arose from the desire to understand the origin and diversity of biological forms In recent years however evolutionary genetics with its focus on the modification and inheritance of presumed genetic programs has all but overwhelmed other aspects of evolutionary biology This has led to the neglect of the study of the generative origins of biological form Drawing on work from developmental biology paleontology developmental and population genetics cancer research physics and theoretical biology this book explores the multiple factors responsible for the origination of biological form It examines the essential problems of morphological evolution why for example the basic body plans of nearly all metazoans arose within a relatively short time span why similar morphological design motifs appear in phylogenetically independent lineages and how new structural elements are added to the body plan of a given phylogenetic lineage It also examines discordances between genetic and phenotypic change the physical determinants of morphogenesis and the role of epigenetic processes in evolution The book discusses these and other topics within the framework of evolutionary developmental biology a new research agenda that concerns the interaction of development and evolution in the generation of biological form By placing epigenetic processes rather than gene sequence and gene expression changes at the center of morphological origination this book points the way to a more comprehensive theory of evolution

The Origin of Individuals, Jean-Jacques Kupiec, 2009. In the 17th century, Descartes put forth the metaphor of the machine to explain the functioning of living beings. In the 18th century, La Mettrie extended the metaphor to man. The clock was then used as the paradigm of the machine. In the 20th century, this metaphor still held, but the clock was replaced by a computer. Nowadays, the organism is viewed as a robot obeying signals emanating from a computer program controlled by genetic information. This book shows that such a conception leads to contradictions, not only in the theory of biology but also in its experimental research program, thereby impeding its development. The analysis of this problem is based on the most recent experimental data obtained in molecular biology, as well as the history and philosophy of biology. It shows that the machine theory did not succeed in breaking with Aristotle's finalism. The book presents a new approach to biological systems based on cellular Darwinism. Genes are ruled by probabilistic mechanisms allowing cells to differentiate stochastically. Embryo development is not governed by a determinist genetic program but by natural selection occurring among cell populations inside the organism. This theory has considerable philosophical consequences. Man may be a machine, but he is a random one.

Origins of Life Freeman Dyson, 1999-09-28 How did life on earth originate Did replication or metabolism come first in the history of life In this book Freeman Dyson examines these questions and discusses the two main theories that try to explain how naturally occurring chemicals could organize themselves into living creatures The majority view is that life began with replicating molecules the precursors of modern genes The minority belief is that random populations of molecules evolved metabolic activities before exact replication existed Dyson analyzes both of these theories with reference to recent important discoveries by geologists and chemists His main aim is to stimulate experiments that could help to decide which theory is correct This second edition covers the enormous advances that have been made in biology and geology in the past and the impact they have had on our ideas about how life began It is a clearly written fascinating book that will appeal to anyone interested in the origins of life
