## Identifying DNA as the Genetic Material

DNA was identified as the genetic material relatively recently, unlike proteins. The initial studies were conducted by two teams that added up to this discovery: 1) Oswald Avery's research, in which he experimentally used 1) *Streptococcus pneumoniae* bacteria, 2) Griffith's research, 3) Griffith's research, and 4) Griffith's research. Together, these scientists showed that DNA is the genetic material.

### Griffith finds a "transforming principle."

In 1928, a British microbiologist named Frederick Griffith discovered that bacteria of the *Streptococcus pneumoniae* species could "transform" from non-virulent to virulent. He found that the virulent form was more heat stable than the non-virulent form. He also found that the virulent form could be killed by heat.

Griffith used bacteria that had a capsule of the virulent strain containing bacteria that were heat-killed. He found that the virulent strain was still virulent after being heated. He also found that the virulent strain was still virulent after being heated.

Griffith concluded that some "transforming principle" from the virulent strain was responsible for the transformation. He called this "transforming principle." He also found that the virulent strain was still virulent after being heated.

Griffith's research "transformed" the way we think about DNA. He found that the virulent strain was still virulent after being heated.

*Wild Immunology—The Answers Are Out There* Gregory M. Woods, Andrew S. Flies, 2019-03-20 Go into partnership with nature she does more than half the work and asks none of the fee Martin H Fisher Nature has undertaken an immense amount of work throughout evolution The evolutionary process has provided a power of information that can address key questions such as Which immune molecules and pathways are conserved across species Which molecules and pathways are exploited by pathogens to cause disease What methods can be broadly used or readily adapted for wild immunology How does co infection and exposure to a dynamic environment affect immunity Section 1 addresses these questions through an evolutionary approach Laboratory mice have been instrumental in dissecting the nuances of the immune system The first paper investigates the immunology of wild mice and reviews how evolution and ecology sculpt

differences in the immune responses of wild mice and laboratory mice A better understanding of wild immunology is required and sets the scene for the subsequent papers Although nature doesn't ask for a fee it is appropriate that nature is repaid in one form or another The translational theme of the second section incorporates papers that translate wild immunology back to nature But any non human non laboratory mouse research environment is hindered by a lack of research tools hence the underlying theme throughout the second section Physiological resource allocation is carefully balanced according to the most important needs of the body Tissue homeostasis can involve trade offs between energy requirements of the host and compensatory mechanisms to respond to infection The third section comprises a collection of papers that employ novel strategies to understand how the immune system is compensated under challenging physiological situations Technology has provided substantial advances in understanding the immune system at cellular and molecular levels The specificity of these tools e g monoclonal antibodies often limits the study to a specific species or strain A consequence of similar genetic sequences or cross reactivity is that the technology can be adapted to wild species Section 4 provides two examples of probing wild immunology by adapting technology developed for laboratory species
