Geometries on Surfaces Burkard Polster, Gu nter Steinke, 2001-10-03 The projective M bius Laguerre and Minkowski planes over the real numbers are just a few examples of a host of fundamental classical topological geometries on surfaces This book summarizes all known major results and open problems related to these classical point line geometries and their close nonclassical relatives Topics covered include classical geometries methods for constructing nonclassical geometries classifications and characterizations of geometries This work is related to many other fields including interpolation theory convexity the theory of pseudoline arrangements topology the theory of Lie groups and many more The authors detail these connections some of which are well known but many much less so Acting both as a reference for experts and as an accessible introduction for graduate students this book will interest anyone wishing to know more about point line geometries and the way they interact

Excavations at Kerma ... George Andrew Reisner, 1923 **English Mechanic and World of Science** , 1883 *Circle Systems* Raymond R. Fletcher III, A research monograph introducing circle systems If G is an abelian group g is an element of G and f is an injective mapping from G into the real projective plane such that for each four element subset $a b c d$ of G with sum g the corresponding points $f a f b f c f d$ are cocyclic then the set of points $f G$ and the associated cocyclic quadruples is a $G g$ circle system The group G is the base of the system and the element g is the sum Circle systems with various bases and sums are constructed and their properties determined In particular it is shown that the points of a circle system lie on a self inversive cubic or quartic algebraic curve which we call the envelope of the system The ternary hypercommutative algebra which is defined on the envelope is used to study algebraic properties of circle systems Circle systems with noncircular conic envelope are also studied
