### Abstract

**Background:** *Micrococcus yunnanensis* (*M. yunnanensis*) is an endophytic actinomyces that was originally isolated from the roots of *Polyspora axillaris* in 2009, and no human infections caused by this organism have yet been reported. We report the first case of community-acquired pneumonia caused by *M. yunnanensis* and propose that *M. yunnanensis* should be considered as an emerging pathogen in medical practice. A 30-year-old woman was admitted to our hospital with fever, paroxysmal dry cough with sputum, and pharyngalgia. Laboratory tests revealed an increase in several inflammatory indicators, and a computerized tomography scan of the chest showed scattered infection foci in both lungs. Bronchoalveolar lavage fluid was collected via bronchoscopy for microbial culture and pathological examination.

**Methods:** The isolate from bronchoalveolar lavage fluid was identified as *M. yunnanensis* by 16S rRNA gene sequencing. The patient was diagnosed with community-acquired pneumonia based on the diagnostic criteria.

**Results:** The patient was treated with intravenous amoxicillin/clavulanate potassium, levofloxacin hydrochloride tablets, and compound methoxyphenamine capsules on the day after admission. After 3 days of treatment, the patient's physiological conditions and inflammatory indicators normalized, and 6-month follow-up showed no abnormalities.

**Conclusion:** Although the pathogenicity of *M. yunnanensis* is unclear, the present case indicates an emerging pathogen in medical practice. MALDI-TOF MS has a limited ability to identify novel or rare pathogenic species, and 16S rRNA gene sequencing is of great value in some circumstance.

**Abbreviations:** AST = antimicrobial susceptibility test, BALF = bronchoalveolar lavage fluid, MALDI-TOF MS = matrix-assisted laser desorption/ionization/time of flight mass spectrometry.

**Keywords:** 16S rRNA, case report, community-acquired pneumonia, emerging pathogen, *Micrococcus yunnanensis*.

## 1. Introduction

*Micrococcus yunnanensis*, an endophytic actinomyces, was initially isolated from the roots of *Polyspora axillaris* in Yunnan Province, South-west China.<sup>[1]</sup> Subsequent studies have reported that *M. yunnanensis* was also isolated from *Carlinus roosei* and pharmaceutical sewage.<sup>[2–4]</sup> Recently, Lee et al reported the complete genome sequence of *M. yunnanensis* T19 obtained from the skin of the forehead of a

healthy volunteer.<sup>[5]</sup> *M. yunnanensis* has been characterized as a nonpathogenic organism that shows no external signs of infection in its host. Most studies have focused on the role of *M. yunnanensis* in industrial wastewater treatment and plant growth promoting activities,<sup>[6–7]</sup> little is known about its role in the medical field. Here, we describe a case of human infection caused by *M. yunnanensis* isolated from bronchoalveolar lavage fluid (BALF) of a patient diagnosed with community-acquired pneumonia.
